The Importance of Risk Control

Every month, it seems that there is new commentary in the media about what is influencing the upward or downward trajectory of the markets. Last year's decline in the equity market was blamed on the falling price of oil. This year's upward momentum in the equity market has been largely characterized as resulting from low interest rates that have left investors with fewer places to find investment returns.

When equity markets are rising, it can be easy to get caught up in the excitement. When markets are falling, it may be difficult to believe that the negativity will eventually end. Some of the most successful investors are able to put these emotions aside when they make portfolio decisions, regardless of their specific strategy. This means following portfolio guidelines that have been established to control risk — for example, rebalancing to a certain asset mix, or limiting the size of any one holding, while maintaining quality criteria for the overall portfolio.

Although this approach may not involve trading the supposed headline equities that are hyped during the good times, it may help to guard against being caught in the prevailing momentum by identifying potential risks that may not be overly apparent. After all, too often we have seen those superstars fall just as quickly as they gained upward momentum.

In times of market volatility, risk control measures are important as they may help limit downside risk. These measures can also remind investors that it is important to remain invested and that overly defensive tactics, including avoiding the markets, may not be appropriate over the longer term.

Portfolio guidelines may be influenced by many factors, including your investment objectives, personal needs, stage of life and risk tolerance. In addition to following these guidelines, we are constantly reviewing securities and classifying them by their financial characteristics, based on their level of risk and return and how they may change under various market conditions. Together, these and other factors are carefully considered when recommending and revisiting your portfolio holdings. As time passes, these factors can change — for example, there was a time when low-risk, fixed income products like government savings bonds generated suitable income for investors, but in today's low interest rate environment this is no longer the case.

Having these portfolio guidelines, and consistently following them, is just one important element of risk control that has been put in place to support investment success. If you have any questions about this, or any other aspect of risk management, please don't hesitate to get in touch.

Planning Ahead

Are You Nearing the Age of 71?

If you are nearing the age of 71, don't forget that you will need to wind up your registered Retirement Savings Plan (RSP) by December 31st of the year in which you turn 71. Remember to plan ahead as there are a variety of tax-deferral opportunities that may be considered. As always, please seek the advice of a tax professional regarding your specific situation.

Consider your options. There are three maturity options that can be used on their own or in combination: i) transfer funds to a registered Retirement Income Fund (RIF); ii) distribute funds as income; or iii) purchase an annuity. Many factors will impact which option is best for you, and we can help you to carefully consider the options as they apply to your situation.

Still working at age 71? Since RSP contribution room is based on your previous year's earned income, if you are still working at age 71, you may be creating RSP contribution room for the following year. If you have already contributed the maximum amount for the current year (based on your previous year's earned income), there may be an opportunity to contribute an additional amount (based on the current year's earned income) at the end of the year. The additional contribution (in excess of the \$2,000 lifetime over-contribution amount, if available) will be subject to a penalty of 1 percent per month. (You will need to file form T1-OVP with the Canada Revenue Agency and pay this penalty within 90 days from the year end.)

However, in January of the next year, this contribution may no longer be considered to be an over-contribution. Where this is the case, the penalty may apply for one month (if the over-contribution was made in December), but may be offset by tax-deferred growth from the extra contribution if it remains invested in a registered plan such as an RIF.

Working past the age of 71? If you have a younger spouse/ common-law partner, income earned in the year you turn 71 and beyond may allow you to make a spousal RSP contribution until the end of the year that your spouse turns 71. This can be made by the regular RSP deadline. Be aware — after age 71, RSP contribution room information will not be shown on your Notice of Assessment, so you will need to calculate this on your own.

Changing Regulations

Pension Reform: The CPP is Set to Change

During the summer, nine provinces agreed to make enhancements to the Canada Pension Plan (CPP). This is intended to address the shortfall in middle-income retirement planning. As the number of company-sponsored defined-benefit pension plans declines, supporters of these changes believe that this will help many working Canadians to save for retirement. (Note: Quebec did not join in these reforms and intends to make changes to its own provincial pension regime.)

Remember that in order to collect CPP benefits, you generally need to contribute to the CPP during your employment years. The CPP is fully funded by two groups: the employer and the employee. Funds are managed by a group of professionals under the CPP Investment Board. As such, these new reforms will not assist those who do not contribute to the CPP during their working years.

Here are the proposed CPP changes, expected to begin in 2019:

- **Higher payouts** — The annual payout target will increase by one-quarter to one-third annually. For a worker earning \$54,900 per year, the 2016 maximum annual pension payment

is \$13,110 at the age of 65. This is expected to rise to around \$17,500 in today's dollars.

- **Greater contribution rate** — CPP contributions from both workers and employers will gradually increase by 1 percentage point, to 5.95 percent of wages. This will be phased in between 2019 and 2023.
- **Increased income coverage** — The maximum amount of earnings subject to CPP contribution will increase. Currently the year's maximum pensionable earnings is \$54,900. This is expected to rise to \$82,700 (phased in) by the year 2025. A lower contribution rate, expected to be 4 percent, has been proposed for earnings between \$54,900 and \$82,700.
- **Tax deduction** — A new tax deduction has been proposed for the portion of additional worker contributions as a result of these changes to help ease the potential financial burden.

Who will benefit? Younger employees are expected to benefit the most from these changes. In order to earn the full CPP amount proposed, a person will generally need to fully contribute for around 40 years once the program is fully phased in by 2025.

Transferring Wealth: Preparing Your Heirs

An article published in Time Magazine¹ last year pointed to some surprising statistics about how we commonly fail in the transfer of wealth: 70 percent of high-net-worth families lose their wealth by the second generation, and 90 percent by the third. As the article noted, it only “takes the average recipient of an inheritance 19 days until they buy a new car.”

But loss of wealth, from poor investment or business decisions, as examples, is not the only potential consequence of passing along an inheritance. Some individuals may be concerned about lessening an heir’s desire to achieve success on their own terms, or, the potential for a breakdown in a family relationship.

As you plan the transfer of wealth, it is important to determine if your heirs are ready. Here are some ideas to help prevent potential unpleasant outcomes:

Share assets during your lifetime. Sharing assets while you are alive may help you to understand whether your heirs are able to manage future wealth. This may include providing loans to heirs (with or without interest and/or capital repayment), which can provide the benefits of capital to the beneficiary, and protect assets if there is a relationship breakdown or the giver requires the assets at a later point in time.

Establish a trust. A trust can help to protect funds until a beneficiary may be more responsible, or a trustee can be appointed to manage the assets on the heir’s behalf. Trusts can also be used to specify how certain assets will be used. Using a trust may also protect assets against creditors or in the event of separation or divorce.

Teach (grand)kids about money. Starting early and teaching the next generation(s) about financial literacy can go a long way, not only to instill responsible behaviour in your

heirs with their own money, but also with any inherited funds down the road.

Talk about it. Some experts suggest that it is important to have a discussion with heirs while you are alive and able to express your views. This may include providing a financial road map for expectant heirs or discussing the details of an estate plan to help address future potential conflicts today. These are personal preferences, and we can act as a resource as you plan any financial discussions.

Effective estate planning remains a key component of successful wealth planning. These are only some of the ways to help prepare your heirs and help to promote the longevity of your wealth. As every situation is unique, we can connect you with an estate planning specialist or legal advisor to help you build the legacy you wish to achieve.

Unclaimed Balances: Are Funds Owed to You?

How is it possible to lose track of millions of dollars?

In Canada, over \$620 million of funds remain unclaimed — in fact, 1.7 million unclaimed balances currently exist on the Bank of Canada’s books as of December 2015. This includes Canadian-dollar deposited or negotiable instruments, such as Guaranteed Investment Certificates (GICs), term deposits, bank drafts or money orders that were issued or held by a bank or trust company where there has been no activity for 10 years and the owner cannot be contacted by the holding institution.

The Bank of Canada acts as a custodian on behalf of the owner of the unclaimed balance and holds the balance for 30 years after the 10-year period of inactivity. You may be eligible to claim the balance if you are: i) its rightful owner; ii) an heir to

an estate with an unclaimed balance; or iii) an officer of an organization entitled to the unclaimed balance.

The significant value of unclaimed balances suggests that it may be easier than we think to lose track of funds. In a broader context, bank accounts may be neglected over time, or, if a recipient moves, cheques or retirement plan account mailings may be returned as undeliverable and forgotten. As such, this is a good reminder to maintain updated records to help keep all of your assets in check. Consolidating assets may also make it easier to prevent funds from being forgotten, and we may be able to assist you with this.

To search for an unclaimed balance to which you may be entitled, see: bankofcanada.ca/unclaimed-balances/

What Do I Tell My Kids: Reduce Mortgage Debt or Save for Retirement?

Canada's housing market continues to reach new highs. As the average price of a home has now surpassed \$500,000, largely driven by the Toronto and Vancouver markets, many new homeowners face increasing mortgage debt.¹ A common question we are asked: for those in their primary saving years, is it better to reduce mortgage debt or save for retirement?

At the end of the day, while reducing mortgage debt and saving for retirement will both help increase a household's net worth, it may be better to choose one over the other. Here are some considerations:

Compounded Growth — The effect of compounded growth on an investment can be significant, especially for individuals who will retire decades in the future. Consider the difference in outcome for a 30-year old who invests \$20,000 per year for 20 years, versus one who starts 10 years later and invests \$40,000 per year for 10 years. At an annual rate of return of 5 percent, the individual who started earlier will have an additional \$160,000, and this will grow to over \$460,000 to age 70. This simple example shows the potential benefit of starting earlier.

Mortgage Interest Rate vs. Expected Return on Investments — Paying down debt offers a guaranteed return, in that the mortgage's interest rate can be considered the

guaranteed benefit for each dollar of the principal that is repaid. In a situation where the individual expects to have a higher pre-tax return on investments within a retirement savings plan, it may be beneficial to invest additional funds rather than reduce mortgage debt (see sample calculation below).

Income Taxes — To save for retirement in a registered Retirement Savings Plan (RSP), contributions are made with pre-tax dollars, meaning that for every \$1 earned, \$1 is invested. RSP contributions benefit from tax-deferred growth until withdrawn. To pay down a mortgage, after-tax dollars are used. Assuming the individual has a marginal tax rate of 40 percent, for every \$1 earned, only \$0.6 would be available to make mortgage payments. If the individual's marginal tax rate in retirement will be lower, this may boost the benefit from investing in an RSP, since less tax will be paid at the time of the RSP withdrawal.

These are only some of the considerations that may influence the decision of whether to reduce mortgage debt or save for retirement. Other aspects, such as investment risk tolerance or comfort with debt, may also come into play. As every situation is unique, we can offer our perspective. We also suggest seeking the advice of qualified tax and legal advisors.

Source: 1. Canadian Real Estate Association, crea.ca/stats/

Example: Pay Down Mortgage Debt vs. Contribute to the RSP

For a \$600,000 mortgage at a fixed rate of 4 percent: Couple #1 contributes \$72,000/year to fully paying down the mortgage, then contributes \$72,000/year to an RSP (assuming unused contribution room) with an annual rate return of 5 percent. Couple #2 contributes \$36,000/year to paying down the mortgage and \$36,000/year to an RSP with the same rate of return of 5 percent.

	Couple #1: Fully pays mortgage, then contributes to RSP	Couple #2: Contributes equally to mortgage & RSP
Time to pay down mortgage	10 Years	21 Years
Net worth at 10 years	\$654,971	\$698,577
Net worth at 20 years	\$1,948,700	\$2,025,504

Note: The calculations assume 2 percent inflation per year (including on contribution). Net worth is assumed to be value of home equity plus RSP. Does not account for taxes or the increase in home value over the period.
