Spring 2026

Volatility Returns

“The old order is not coming back. We shouldn’t mourn it. Nostalgia is not a strategy. But we believe that from the fracture, we can build something better, stronger, more just.”
— Prime Minister Carney, January 2026¹

Volatility returned to start the year, not just in financial markets, but in U.S. policy, driving geopolitical uncertainty amid widening global conflict. Even before recent events, this drove a flight to safety in precious metals, with swings in gold and silver prices, alongside a weakening U.S. dollar. Volatility extended to certain technology stocks, which, despite solid earnings, were punished for elevated capital spending, with concerns about the impact of artificial intelligence spreading beyond the sector.

Trade rhetoric has been similarly volatile as the U.S.-Mexico-Canada Agreement (USMCA) renegotiations approach. With exports to the U.S. alone accounting for around 20 percent of Canada’s GDP, investors are watching closely to see whether threats translate into action.² Many economists expect the agreement to survive in some form, likely on terms favourable to the U.S., as a full dismantling would risk inflation, job losses and broader disruption during a U.S. midterm election year.

Even so, an Oxford Economics analysis suggests that a full collapse would reduce Canada’s GDP by about 1.8 percent below baseline and cut private investment by 6 to 7 percent — serious, but far from catastrophic.³ By comparison, the early 1980s recession, driven by high inflation and tightening monetary policy, saw output fall by around 5 percent and unemployment reach 12 percent, a reminder that Canada has endured far more severe shocks and recovered. Elevated Canada-U.S. trade barriers are also not unprecedented, having persisted for long stretches during the 19th and 20th centuries.

While acknowledging the risks, Canada’s underlying strengths should not be overlooked. Our nation is an energy superpower with vast natural resources, abundant fresh water, three coastlines and the world’s most-educated population. Canada’s political and economic stability offers a strong foundation for investors and businesses. Regardless of political views, current leadership is actively working to reorient the economy and pursue a new agenda focused on defence spending, trade and security agreements, and deepening ties with global trade partners.¹

The broader lessons carry into investing. Markets are inherently volatile, and conditions that appear stable can shift quickly. No cycle, policy regime or market trend is permanent. In that context, diversification is not simply a safeguard but a necessity

To Our Clients:

Spring is often referred to as the season of renewal, a time when many reassess their priorities. If you have friends or relatives seeking a fresh perspective on an existing portfolio or advice on a new financial situation, we would be pleased to offer our experience and support. Please feel free to share our information or this newsletter with them. We remain grateful to those who have made introductions and appreciate your continued trust in our services.

Wishing you many warm days ahead.

— Melinda & Brendan

for managing risk. At a time when uncertainty feels amplified and global policy-making remains volatile, discipline becomes increasingly important, particularly when the range of possible outcomes is wide. Conviction, paired with flexibility, allows investors to stay positioned while adapting as conditions evolve, an essential part of effective portfolio oversight. History also offers perspective: many periods of disruption are ultimately weathered. While the road ahead may be complex, Canada has the capacity, the tools and resilience to navigate it.

■ Tax Season & the CRA

Planning for CRA Instalment Payments

If tax isn't being withheld from your income, did you know you may be responsible for quarterly instalment payments?

Business owners and self-employed individuals may generally be familiar with the Canada Revenue Agency's (CRA) instalment payment process. However, many new retirees, or those newly self-employed, are often surprised to learn that they may be required to remit quarterly instalment payments to the CRA. This is because, during their working years, employers deducted and remitted income tax on their behalf throughout the year, whereas retirement or self-employed income is often received without tax withheld at source.

If your net tax owing is more than \$3,000 (\$1,800 for Quebec) in the current year and in either of the two preceding years, you generally must make instalment payments by March 15, June 15, September 15 and December 15 (with exceptions for farmers and fishers).

Why This Is Important

Cash Flow Management — Proper planning helps ensure you have sufficient cash set aside to make quarterly payments.

Missed Payments — If you miss an instalment payment or pay late, interest and penalties may apply. Interest on overdue amounts is compounded daily by the CRA at the prescribed interest rate, which is 7 percent in Q2 2026. A penalty will be charged if instalment interest charges for the current year exceed \$1,000.

Potential "Overpaying" — The CRA often calculates instalments based on your most recent assessed tax return. If your income varies from year to year, adjusting payments annually can help avoid overpaying the CRA, which effectively acts as an interest-free loan. For example, a significant one-time capital gain, such as from

selling a vacation home, may cause CRA-suggested instalments for the following year to exceed what your expected income would warrant.

Practical Tips to Manage Instalments

You can reduce/eliminate accrued interest by overpaying subsequent instalments or making payments early. Early instalment payments earn CRA instalment credit interest, which is not refundable but can offset interest charged on late instalments in the same year.

Three options are available to calculate instalments. Instalment payments may be based on CRA-calculated amounts, your prior-year tax return or your current-year income estimates. Choosing the appropriate method is particularly important if your income fluctuates from year to year, to ensure you pay sufficient amounts without overpaying and effectively providing the CRA with a tax-free loan. For more information: <https://www.canada.ca/en/revenue-agency/services/payments/payments-cra/individual-payments/income-tax-instalments/options-calculate.html>

Instalments may be reduced or eliminated by having tax withheld at source, or by increasing the amount of tax deducted from OAS, CPP/QPP benefits, EI or employer-sponsored pension income. Requests must be made through Service Canada or Retraite Québec. Note: tax cannot be withheld from certain types of income, including self-employment, investment, rental income or capital gains.

Home Economics: A Look at the Housing Market Over Time

Spring marks the start of the home-buying season. Over the past year, however, activity and price growth in many markets have slowed or even reversed. Despite this, real estate remains widely viewed as one of the most successful long-term asset classes, after decades of steady appreciation. Yet since the start of the millennium, an interesting comparison emerges: the S&P/TSX Composite, despite more volatile returns, has generated higher annualized total returns than many Canadian real estate markets. The chart illustrates performance through the start of last year, as housing price gains moderated, in part due to higher interest rates.

Of course, numerous factors make a direct comparison between real estate and stocks difficult. Investing in real estate involves several considerations, including limited liquidity, significant capital requirements (partially offset by leverage, such as a mortgage), transaction costs (commissions, legal fees and land transfer taxes) and ongoing maintenance expenses (property taxes and repairs).

Stock market participation is generally more accessible, with lower initial capital requirements, reduced

transaction costs and greater liquidity, while also offering broader diversification. However, the stock market can be more volatile, and downturns can be more psychologically challenging for investors. Differences in tax treatment further complicate direct comparisons.

Recent cooling in housing market activity also serves as a reminder that even long periods of strong price growth can give way to slower conditions. Yet, Canadians have been fortunate that both real estate and equities have offered substantial wealth-building opportunities over recent decades.

■ Keeping More of What You Earn

Do You Have a Tax-Efficient Withdrawal Strategy?

It's tax season once again, a reminder that wealth is built not only by how it grows, but by how efficiently it is taxed.

Understanding how and when you access different income sources is key to managing the taxes you pay, your eligibility for government benefits and your longer-term financial health. Whether you are accumulating assets, navigating a career transition or preparing for retirement, a thoughtful, tax-efficient withdrawal strategy can make a meaningful difference. Here is a brief overview of common income sources, along with ideas to help optimize withdrawals:

Non-Registered Accounts — Tax treatment depends on income type: interest (fully taxable), dividends (may be eligible for the dividend tax credit) and capital gains (based on the inclusion rate, currently 50 percent). Tax-loss harvesting can help offset capital gains to reduce tax.

Registered Retirement Savings Plan (RRSP) — Withdrawals are fully taxable and subject to withholding tax. Importantly, once funds are withdrawn, the contribution room is permanently lost.

TFSA — Offers significant benefits as growth is tax free and withdrawals are not taxed. This means withdrawals do not affect income-tested government benefits. Amounts withdrawn can be recontributed in the following calendar year.

Employment Income — If you continue to work while drawing income from other sources, consider how employment income will stack with taxable withdrawals. In high-income years, deferring benefits (if possible) or adjusting other withdrawals may help reduce the overall tax burden.

Here are additional considerations for those nearing retirement:

Canada Pension Plan (CPP) — CPP benefits are taxable income. Timing matters: starting early reduces benefits by 7.2 percent per year before age 65. Delaying increases payments by 8.4 percent per year after age 65, to a maximum of 42 percent by 70. The total benefit received can impact income level and tax situation.

Old Age Security (OAS) — OAS is a taxable benefit starting at age 65. If you expect a higher income later in life, here are two considerations: **i) Clawback** — If net income exceeds \$95,323 (2026), OAS is reduced by 15 percent of the excess. At \$154,708 (ages 65 to 74), it is fully clawed back; and **ii) Delaying OAS** — This increases the benefit up to 36 percent by age 70.

Registered Retirement Income Fund (RRIF) — Mandatory withdrawals start the year after opening the RRIF, increasing taxable income. Some choose to begin RRIF withdrawals early to manage future tax exposure or reduce future triggering of the OAS clawback.

Company Pension — Pension income is taxable. Generally, after age 65, the pension tax credit can help offset the tax liability. Consider timing a pension's start with other income sources to manage the tax liability.

Don't Forget: Income Splitting — Couples can sometimes lower their combined tax burden by splitting certain types of income, especially when one has a significantly higher income. For retirees, shifting eligible pension income may reduce taxes or the OAS clawback. In cases of continued employment, coordinating taxable income (particularly after 65) may yield tax savings over time. Planning together can lead to better outcomes.

Building a tax-efficient income plan involves many moving parts. Knowing how and when to draw income may help reduce taxes and preserve benefits. Alongside tax advisors, we can help develop a strategy that balances cash flow needs, tax implications and government benefits to support your long-term financial goals.

Equity Market Perspectives: A Brief Look Globally

Ongoing geopolitical tension and geoeconomic events have prompted some questions about global equity markets. The U.S. remains dominant, while Canada's share has fallen to under 3 percent. The scale of U.S. leadership is striking: With just 4 percent of the world's population and around 25 percent of global GDP, the U.S. accounts for half (or more, depending on metrics used) of global equity market capitalization.

Yet the world is never static. The competitive advantages we see today may not persist indefinitely. Consider how much has changed over four decades. Seasoned investors may recall a time when the prevailing view was that Japan would surpass the U.S. as the leading global superpower. In 1989, Japan dominated global markets, accounting for almost 40 percent of global market capitalization. The Nikkei 225 rose from around 12,000 in 1985 to 38,915 in 1989, a 225 percent increase in four years. The U.S. held roughly 30 percent, while developing countries like China and India were virtually absent from the global equity landscape. By the late 1990s, Europe's share (EU and U.K.) had risen to over 25 percent, though today it has fallen to around 12 percent. Since then, China and India have experienced rapid economic expansion and now represent over 13 percent of global share, while Japan's share has fallen to just 5 percent. Few would likely have anticipated the scale

of today's U.S. technology boom just two decades ago.

This is to suggest that nothing in the markets remains permanent. Global leadership can evolve, sometimes in ways that challenge prevailing narratives. Japan's experience is one such example, reinforcing the value of diversification and adaptability in navigating an uncertain future.

■ Business Owners & Succession Planning

Intergenerational Wealth Planning & the Estate Freeze

With significant discussion around increases to the capital gains inclusion rate over recent years, many business owners reviewed strategies to mitigate future tax liability. One such strategy is an estate freeze. Although the proposed changes were ultimately cancelled last year, they brought to light several enduring benefits of this planning technique.

First: What Is an Estate Freeze?

An estate freeze “freezes” your interest in a private corporation at a particular point in time by exchanging your common shares, generally on a tax-free basis, for fixed-value preferred (“freeze”) shares. The corporation then issues new common (“growth”) shares to children or other heirs, with future increases in value to accrue to them. Growth shares may be held directly by heirs or indirectly through a discretionary trust. Many owners retain control by ensuring the freeze shares carry all, or a majority, of the company’s voting rights.

As such, an estate freeze is often considered under certain circumstances, such as:

- During economic downturns, recessions or when there are temporarily low valuations;
- When business or assets are expected to have high future growth or recovery; or
- When future tax rates may be expected to increase.

What Are the Main Benefits?

- **Tax Deferral** — Since the value of the shares you own is fixed, you limit the tax liability that will arise upon death. Any future growth is transferred to heirs, with tax deferred until they dispose of their growth shares or pass away.
- **Increased Estate Planning Certainty** — Fixing the business’s value helps to make the tax liability upon death more predictable, supporting more effective planning, such as the use of life insurance to fund anticipated tax obligations.
- **Lower Estate Value** — Because frozen shares do not increase in value, the overall estate value is expected to be lower, potentially reducing probate fees and estate administration taxes, where they are applicable.

■ Multiplying the Lifetime Capital Gains

Exemption — In certain situations, you may be able to use your lifetime capital gains exemption (LCGE) to shelter up to \$1.25 million of capital gains when freezing your shares (subject to eligibility). Your heirs may be able to use their own LCGE when they dispose of growth shares in the future, potentially increasing the total exemption available to the family.

- **Facilitating a Transition** — If structured to retain control, an estate freeze can support a gradual transition of the business. Heirs gain a vested interest in future growth, while the founder can maintain operational and governance oversight.

Is an Estate Freeze Right for You?

Several factors should be considered when determining whether an estate freeze is appropriate:

- **Current Business Value** — Because a freeze locks in the current value, a lower valuation may help to make it more tax efficient.
- **Future Growth Prospects** — A key benefit is transferring future growth to the next generation. If growth prospects are limited, alternative strategies may be more suitable.
- **Your Time Horizon and Financial Position** — You should be confident that the fixed value of frozen shares and your other assets will provide sufficient financial security for your lifetime. If you aren’t ready to transfer all future growth, a partial freeze (i.e., you acquire a portion of the new growth shares) or flexible freeze (i.e., you become a beneficiary of a discretionary trust) may be appropriate.
- **Age and Interest of Heirs** — Heirs should be ready and willing to assume an ownership interest. If heirs are minors, or if flexibility is needed, a discretionary trust may be a viable alternative.

An estate freeze can be an effective succession and tax-planning strategy, but it isn’t suitable in every case. As always, please consult qualified professionals, such as TD specialists, to determine the best approach for your situation.
